What are neurosteroids?

Neurosteroids are steroids synthesized within the brain that modulate neuronal excitability by rapid non-genomic actions

Endogenous steroids that modulate CNS behavior

- *Mood*, neuroprotection, excitability

Therapeutically used as *i.v.* *anesthetics*, anti-depressants and anti-epileptics

Clinically used steroid anesthetics

Alphaxolone

1971-1985

- **Althesin**- Alphaxolone/Alphadolone in Cremophor EL
- The most widely used i.v. anesthetic in Europe/Canada
- Minimal adverse effects on CV or respiratory
- Histamine reactions/anaphylaxis due to Cremophor
- Withdrawn from Canada and Europe in early 1980's

Therapeutic indices

	Mice	Rats
Hydroxydione	17.3	-----
Althesin	30.6	28.7
Pregnanolone	-----	40.0
Thiopental	6.9	4.6
Propofol	-----	5.1
Midazolam	-----	6.8

Alphaxalone Reformulated: A Water-Soluble Intravenous Anesthetic Preparation in Sulfobutyl-Ether- β -Cyclodextrin

7-sulfobutyl-ether- β -cyclodextrin

Table 1. Doses Causing Loss of Righting Reflex and Tail Pinch Responses and Lethality Plus Recovery Rates for 2 Alphaxalone Preparations (PHAX and ALTH) and Propofol (PROP)

	ALTH	PHAX	PROP
Minimal anesthetic dose causing all rats in a group of 10 to lose righting reflex, mg/kg	5	5	10
ED ₅₀ dose for loss of righting reflex, mg/kg mean (95% CI)	3.0 (2.4–4.5)	2.8 (2.2–4.3)	4.6 (3.8–5)
ED ₅₀ dose for loss of tail pinch response, mg/kg mean (95% CI)	6.5 (4.7–8.4)	6.6 (5–8.3)	8.4 (6.7–10.4)
LD ₅₀ , mg/kg mean (95% CI)	43.6 (40.7–46.6)	>84	27.7 (26.3–29)
Duration of loss of righting reflex after minimal anesthetic dose that caused all 10 rats to lose righting reflex, minutes mean (95% CI)	2.8 (1.8–3.8) ^a	2.2 (1.6–2.8) ^a	2.8 (2.1–3.6) ^a
Time (minutes) to complete recovery of rotarod Performance after minimal anesthetic dose (all 10 rats lost righting reflex), mean (95% CI)	19.9 (17.1–22.7) ^b	17 (15.4–18.5) ^b	16 (14.6–17.3) ^b

Neurosteroid (NS) actions on GABA_AR

- ✓ Neurosteroids are endogenous modulators of neuronal excitability and nervous system development
- ✓ GABA_ARs are the primary molecular targets of neurosteroid action
- ✓ Neurosteroid enhancement of GABA_A currents is the primary mechanism of anesthetic action

✓ **Positive allosteric modulators (PAMs):**

Allopregnanolone

Tetrahydrodeoxycorticosterone (THDOC)

Neil Harrison, Mike Simmonds, Jeff Barker

Neurosteroid (NS) actions on GABA_AR

- ✓ Neurosteroids are endogenous modulators of neuronal excitability and nervous system development

Summary

- Neurosteroids bind to multiple sites on the GABA_A receptor
- Different neurosteroids bind to overlapping subsets of these sites
- Different neurosteroids can be PAMs or NAMs at a given site
- There may be additional neurosteroid binding sites in GABA_A receptors with different subunit composition and cyclic order

Conclusions

- The matrix of multiple endogenous neurosteroids bathing GABA_A receptors and the array of subunit compositions expressed with cellular and anatomic specificity indicates a **complex endogenous pharmacology in which neurosteroids fine tune neuronal excitability and regulate behavior (mood)**
- The structural complexity of neurosteroids and (and their binding sites) presents an opportunity to develop neurosteroid analogues that are **site-specific agonists** and **antagonists** for fine-tuning sedation, anesthesia and mood
