## The Heart Rate variability (HRV).

• The time between each consecutive R peaks vary, hence the term HRV. The interval between each beat is different, this creates variation

#### Heart Rate Variability in the frequency domain The power and the central frequency of LF and HF vary in relation to changes in autonomic modulations of the heart rate Physiological interpretation is much less $VLF \leftrightarrow$ defined, associated recently with vagal PSD (ms<sup>2</sup>/Hz) control\* $HF \leftrightarrow Parasympathetic$ , efferent vagal activity 0.04 0.15 0.4 Hz \* Makowiec et al. EPL 2011;94:68005. Frequency (Hz) 3

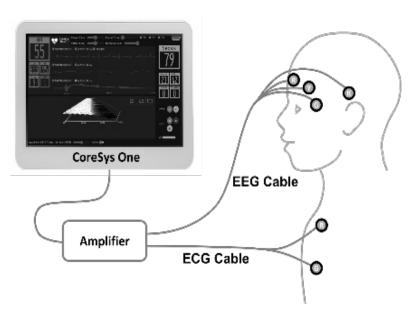

## Methods.

- Two EEG channels and one electrocardiogram (ECG) channel were recorded with the CoreSysOne monitor (Fig. 1) at a sampling frequency of 1024 Hz.
- N=15, TIVA

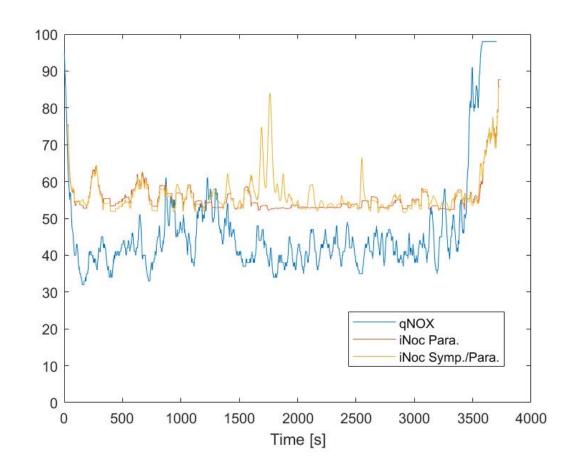

Δ

## Results

	RMSE	MdAPE
Model using	18.03 (13.72-	0.257 (0.212-
LF/HF	21.42)	0.318)
Model using	17.38 (13.89-	0.267 (0.214-
HF	21.82)	0.324)

a. Median Value (Q1-Q3)

### Conclusion

• The two HRV derived indices were not significantly different from the qNOX, calculated through EEG. More studies with a larger population and different models are needed.
